All

Findings:

1. Out of total 46,650 restaurants in bangalore, Around **60%** restaurants deliver food to homes whereas only **10%** restaurants allows reserving tables.
2. Areas like **BTM (Byrasandra, Tavarekere, Madiwala), Koramangla, Jayanagar** are home to a number of educational institutions, including universities and colleges. This could explain the high number of restaurants in bangalore as there is a demand for dining options from students, faculty & tourists.
3. Areas like **Whitefield, Marathahalli, Electronic city, Bellandur, Kammanahalli** are home to a number of technology parks and multinational corporations. This could explain the moderately high number of restaurants in the area as there is a demand for dining options from the large number of people working in the tech parks and offices.
4. Areas like **Indiranagar, Lavelle Road, MG Road, Frazer town, Church Street** are a mix of residential and commercial areas. They are also a popular destination for dining and entertainment, which could contribute to the high number of restaurants in the area.
5. Areas like **Banashankari, Rajajinagar** are older localities and are not as easily accessible as other localities, which could contribute to the lower number of restaurants in the area.

The treemap almost adds up to the findings we discussed above.

1. As **Church Street, Indiranagar, Lavelle Road, MG Road, Frazer town** are popular destination for dining and entertainment, there average cost of dining is highest as compared to other localities.
2. While areas like **Whitefield, Bellandur, Sarjapur Road** are home to big technology parks and multinational corporations. So average cost of dining is moderately high because of higher rents, land prices.
3. Areas like **Koramangala, BTM, Jayanagar** are home to educational institutes, As majority of students are budget constrained, the average cost of dining is economical in these areas.
4. Areas like **Rajajinagar, Banashankari** are old localities which could contribute to the lower average cost of dining as there may be less demand for dining options and less competition among restaurants. Additionally, these areas are not as easily accessible as other localities, which could also contribute to the lower average cost of dining as there may be fewer people visiting the area and therefore less demand for dining options.

Bangalore’s most popular restaurants vs. their average cost of dining

Zomato Restaurant’s Data Analysis: Bangalore

Overview Stats	Interesting Facts	Correlation Analysis
----------------	-------------------	----------------------

Hypothesis #1: Restaurants with higher dining costs have higher ratings

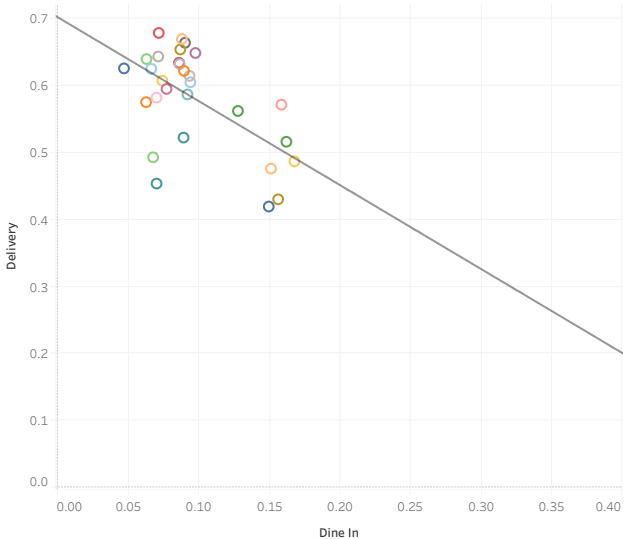

Findings:

- 1. A **positive correlation** was found between dining cost and rating, meaning that higher dining costs were generally associated with higher ratings.
- 2. In this case, the **R^2** value of **0.13** means that the model explains about 13% of the variance in the average cost of dining. This is a low R^2 value, which suggests that the average cost of dining is **not a strong predictor** of the rating of restaurant.
- 3. The p-value of **< 0.0001** indicates that the observed correlation between dining cost and rating is **statistically significant**, meaning it is unlikely to have occurred by chance.

Conclusion :

These findings suggest that dining cost may be one factor that influences the rating of a restaurant, but it is not the only factor. So, the average cost of dining is not a strong predictor of the rating of restaurant. Other factors that may contribute to a restaurant’s rating could include the quality and variety of the food, the ambiance and decor, the service, and the overall dining experience.

Hypothesis #2: The more restaurant’s focuses on dine-in service then less it focuses on delivery service in different localities in bangalore

Findings:

- 1. The **R2** value of **0.34** indicates that there is a **moderate level** of correlation between the focus on dine-in and the focus on delivery. This suggests that there is a relationship between these two variables, but it may not be a strong or linear relationship.
- 2. The p value of **0.0008** suggests that the correlation between the focus on dine-in and the focus on delivery is **statistically significant**, meaning that it is unlikely to have occurred by chance.
- 3. The scatter plot shows that restaurants in posh areas such as Lavelle Road, Residency Road tend to focus more on dine-in service and less on delivery, while restaurants in more economical areas such as BTM and JP Nagar tend to focus more on delivery and less on dine-in. This **supports** the hypothesis that there is a negative correlation between a restaurant’s focus on dine-in and its focus on delivery.

Conclusion:

These findings suggests that there is a moderate, statistically significant negative correlation between a restaurant’s focus on dine-in service and its focus on delivery service, with restaurants in posh areas tending to focus more on dine-in and less on delivery, and restaurants in more economical areas tending to focus more on delivery and less on dine-in. However, it is important to consider that this relationship may be influenced by a number of other factors such as Type of Cuisine, Size of the restaurant, Customer demographics etc.
